

# Environmental management

CNC Project Management helps clients comply with their environmental commitments, as well as manage and improve environmental performance on infrastructure projects.

Our award-winning environmental team has a diverse skill set. We are committed to working efficiently on projects and we achieve this by providing our clients with multi-skilled, flexible and well-rounded qualified environmental practitioners. As a result, we deliver value for money and on-the-ground innovations.

For example, instead of supplying a practitioner with only one specialist area, such as a Fauna Handler, we offer our clients Environmental Field Officers who are qualified in fauna handling. Our officers also have a range of other skills required in on site environmental management including practical knowledge in erosion and sediment control, in field monitoring and compliance reporting. We work efficiently and minimise downtime, while building relationships with the construction workforce.

CNC Project Management has designed and implemented a unique in-house training and competency assessment program. This allows us to enhance the skills of our team members and deliver consistent, high quality outcomes for our clients.

CNC's innovative 'Back of the Ute' Soil Test Procedure won the Australian Pipelines and Gas Association's (APGA) 2014 Environment Award. In 2015, one of CNC's key clients, Spiecapag Lucas Joint Venture, won the APGA Environment Award for its "Front Foot Package" for fauna management, which was jointly developed and implemented by CNC staff. This is a practical example of how we add value to the projects we are involved in and drive on-ground efficiencies.

As well as environmental field work, our experienced Certified Environmental Practitioners (CEnvPs), Certified Professionals in Erosion and Sediment Control (CPESCs) and contaminated land specialists prepare technical reports and management plans. Our environmental systems, plans and procedures are practical, targeted and easy-to-implement in the field.

As a strong contributor in the pipeline industry for many years, CNC led the review of APGA's Code of Environmental Practice in 2013. Our proven management frameworks enable us to implement, manage, measure and report on environmental outcomes in a transparent and accountable way.

## OUR ENVIRONMENTAL MANAGEMENT SERVICES:

- Environmental planning and management
- Environmental Management System preparation and auditing
- Risk assessments
- On-site implementation of environmental approvals conditions
- Compliance auditing
- Fauna handling
- Cultural heritage management
- Erosion and sediment control planning, preparation and implementation
- Contaminated land site assessment and remediation
